

# EcoLeak

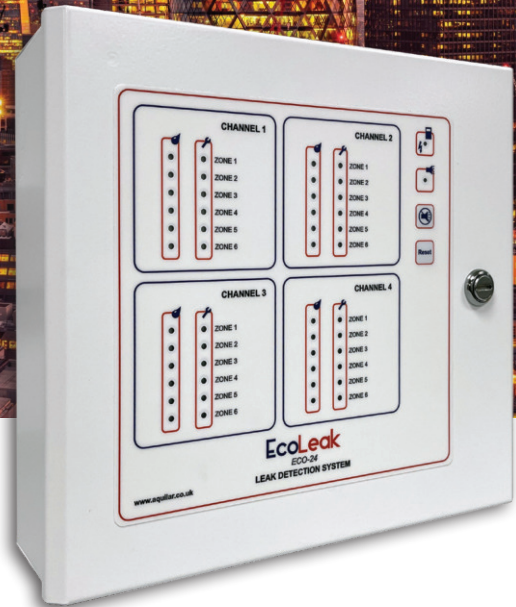

## Introducing the new Eco-24 panel

A multi-zone control panel for water  
and refrigerant gas leak detection

This is a new 24-zone panel which  
can monitor up to 24 Eco-Leak water  
sensing cable, mini probes or AquiTron  
AT-SRG Refrigerant gas sensors.

The 24 zones are split into four channels of six zones. This allows independent control of four areas as each channel has its own set of volt-free relays for control of auxiliary equipment such as BMS, remote alarms, solenoid valves or refrigerant pump down.

The Eco-24 panel is ideally suited to provide centralised monitoring for smaller AT-SRG refrigerant leak detection systems. The compact panel is perfectly suited for installation within reception or security areas, providing fast, effective and sensor-specific alarms for immediate response.

The Eco-24 provides:

- Audible + visual alarms per zone
- Independent channel volt-free relays (4)
- Simple zone enable/disable via dip switches
- Dedicated additional sounder beacon output
- Integrated 12Vdc accessory output (ie powering AT-RAP, AT-SRG, AT-BCN-A)

All three of the EcoLeak panels are suitable for use in small and medium sized areas within residential or commercial buildings to provide cost-effective leak detection.

leak detection solutions

Compact and discreet, the Eco-1 is ideal for placement in kitchens, bathrooms, lift pits, plant rooms and monitoring fan coil units. It is easily mounted onto walls or other flat surfaces and provides simple yet effective warning of leaks via an audible alarm and visible LED.

The Eco-6 has the same advantages as the Eco-1, plus also includes 6-zone sensing and battery back-up.

The Eco-1 and Eco-6 are both designed to work with all AquiTron

and TraceTek sensing cables and can monitor between 1-6 individual sensing zones.

EcoLeak panels alert personnel to any detected leak via both audible and visual alarms. Sensors are available for detecting water, refrigerant gas and even hydrocarbon fuels.

All EcoLeak panels also have volt-free relay outputs for connection to BMS or controlling external equipment making them truly versatile.
